NAMM 2017 : Amptweaker New PressuRizer Compressor/Boost pedal

**Everybody's got a new pedal at NAMM.....but
Amptweaker has the PressuRizer!**

We always get ideas from customers, and one recurring theme was can you make a compressor that 'doesn't mess with my attack?' Well, the new PressuRizer™ pedal is a simple compressor

that can do just that. It has boost built in, and uses parallel compression with a wet/dry blend control, a Tone control, and a FET booster/limiter. A special Bloom circuit allows the compressor to over-compress the signal at first so that when blended with dry, the attack is normal, and the result blooms like a really nice Les Paul.

There's also a special footswitch that allows you to press/hold to lock the compressor on, and then tapping it again boosts the output volume using a side-mounted knob.

For more info and a demo video, click the image above, or this link:
